

Sanjana Krishnan . Jarvis Consulting

I am a Business Systems Analyst in training with a strong foundation in data engineering and analytics. My professional experience includes designing, validating, and optimizing SQL and PySpark data pipelines, as well as implementing ETL processes and working with Informatica. Through this technical background, I discovered my passion for translating complex data into actionable insights and bridging the gap between business needs and technical implementation. I am now focused on developing my BSA expertise by performing requirements analysis, documenting system specifications, supporting Agile delivery, and validating outputs against business objectives. Combining technical proficiency with strong analytical thinking and clear communication, I aim to deliver solutions that align with stakeholder goals and enhance operational efficiency.

Skills

Proficient: RDBMS/SQL, Informatica, Requirements Elicitation, Process Documentation, Story Mapping

Competent: JIRA, Confluence, Stakeholder Engagement, Linux, Git/Github

Familiar: Airtable, Sprint Planning, Docker, Tableau, Elastic Search

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_SanjanaKrishnan

Linux Cluster Monitoring Agent [GitHub]: Implemented a Linux-based resource monitoring solution using Bash scripts and PostgreSQL, then analyzed the system from a BSA perspective to understand its business value. Identified key hardware and usage metrics required for capacity planning and documented how the collected data supports decisions such as scaling servers or optimizing resource allocation. Validated that the Bash scripts, cron schedules, and SQL schema aligned with the intended reporting needs by tracing requirements to actual outputs. Created clear technical documentation and data interpretation notes to translate system behavior and collected metrics into actionable business insights.

SQL Learning & RDBMS Practice [GitHub]: Completed SQL and RDBMS exercises while approaching each query as a business requirement and documenting the underlying business question it answered. Analyzed relational structures, validated data accuracy, and ensured query logic aligned with expected outcomes from a stakeholder perspective. Practiced converting informal questions into structured requirements and verifying results against test data. Developed disciplined documentation habits by writing query explanations and translating technical outputs into insights that support decision-making.

BSA Fundamentals [GitHub]: Executed a comprehensive BSA Fundamentals project focused on understanding a product request, breaking down business objectives, and documenting clear and structured requirements. Conducted requirements analysis to distinguish business needs from technical constraints and translated high-level goals into detailed functional and non-functional requirements. Explored the role of a Business Systems Analyst, gaining insight into how BSA work informs system design, stakeholder communication, and business decision-making. Documented assumptions, questions, and clarifications to simulate stakeholder interactions and ensure requirement completeness. Produced organized BRD- and SRD-style documentation that demonstrated the ability to express business logic, data needs, and expected system behavior clearly and analytically.

Highlighted Projects

Tier Recognition Feature: Analyzed the business requirement to classify healthcare providers into Tier 1/2/3 groups and ensured the logic aligned with how members search for in-network care. Used SQL insert statements to update tier attributes in the source data and validated that changes moved correctly through the ETL pipeline into the final Elasticsearch layer. Performed data checks to confirm that tier values displayed accurately in the provider search and supported user filtering. Documented edge cases, expected behaviors, and validation steps to ensure the implementation met stakeholder expectations.

Extended Hours Feature: Supported the development of extended-hours filtering by consolidating provider schedule data from 10 source systems and validating how each mapped into the integrated data model. Analyzed business rules around after-5pm and weekend availability and ensured they were accurately represented across Informatica workflows, SQL Server stored procedures, and downstream transformations. Verified data propagation through the Oracle layer and final Elasticsearch index to confirm that schedules displayed correctly in the provider search. Conducted UI data

checks, documented assumptions, and outlined test scenarios to ensure the feature met business requirements. Ensured the enhancement improved member and public access by enabling precise filtering based on extended availability.

Client Coaching Data Revamp: Redesigned a fragmented coaching dataset in Airtable by structuring information into standardized tables that reflected coaching workflows and reporting needs. Analyzed business requirements for monthly income tracking and automated email collection to streamline data intake from clients. Built no-code dashboards and visualizations to surface trends and insights for coaching decision-making. Validated data completeness and consistency across automated inputs and reporting views. Improved process efficiency by enabling faster and more accurate visibility into client progress.

Professional Experiences

Business Systems Analyst, Jarvis Consulting (Oct 2025 - Present): Built core BSA competencies through hands-on practice projects by conducting requirements analysis for data-focused initiatives. Translated business goals into technical tasks, identified key data points for reporting and decision-making, and validated SQL outputs and system behaviors against expected requirements. Documented findings, assumptions, and outcomes while communicating progress with instructors and peers, simulating stakeholder collaboration. Strengthened analytical thinking by mapping business needs to data structures and system workflows.

Project Coordinator, Stairway to Leadership (Sept 2024 - Dec 2024): Worked closely with the CEO to clarify business needs, refine requirements, and translate objectives into structured tasks and acceptance criteria. Cleaned and reorganized unstructured client data, defining fields, business rules, and logic for standardized tracking and improved data quality. Built a scalable Airtable workspace unifying 15+ client cases, enabling more accurate reporting and faster decision-making. Developed dashboards and performance insights that supported data-driven coaching strategies. Delivered a final handover package detailing workflows, data logic, and configuration to ensure smooth operational continuity.

Associate Software Engineer, Carelon Global Solutions (Aug 2021 - July 2023): Collaborated with product, BA, QA, and development teams in an Agile Scrum environment, participating in stand-ups, sprint planning, estimation, and reviews. Clarified requirements, refined user stories, and defined acceptance criteria to align features with business objectives. Translated business rules into SQL and PySpark logic, developed and validated data pipelines, and supported data accuracy across large-scale healthcare provider datasets. Partnered with QA to define test scenarios and validate outputs, and authored SRDs, data mapping notes, and workflow documentation to support smooth cross-team handoffs.

Education

Trent University (Sept 2023 - Dec 2024), Master of Management, Business Management

Ramaiah Institute of Technology (Aug 2017 - July 2021), Bachelor of Engineering, Electronics and Communication Engineering

Miscellaneous

- Certified Scrum Master (2025)
- Project Management Professional (2025)
- Avid reader, head of the reading club in high school
